

Players Athletic Development Program + KINETiQ is a year-round, science-driven performance training program designed to enhance athletic development, injury resilience, and long-term performance for Players Baseball Club athletes. This program delivers professional-level testing and training systems typically used in collegiate and elite environments, adapted specifically for youth and developmental baseball athletes.

Program is developed and structured by Coleby Clawson, PhD, DPT, CSCS

- Director of Sports Medicine and Training at Brigham Young University.
- B.S of Exercise Science
- Doctor of Physical Therapy
- PHD Human and Sports Performance

Program Scope and Structure

The program combines:

Structured and supervised performance training sessions

Monthly performance testing & progress tracking

Periodized athlete development systems to support

Personalized athlete sport science progress report 2x/year

Annual Training Duration

44 Weeks of programmed and supervised training (certain weeks around holidays, tournaments, etc, will be taken off)

Weekly Training Frequency

Four Training Sessions Per Week (Monday – Thursday; M,W/ T,Th)

Program is structured for twice/week per age group with daily options available.

Training Groups divided by age for optimal development.

One-hour supervised training sessions in a team setting.

Coaching & Staffing Model

All training sessions will be led by coaches who are:

- Trained directly under Coleby Clawson and following the KINETiQ program
- Certified by the National Strength & Conditioning Association
- Certified by the American Red Cross in CPR and basic first aid

Testing & Performance Monitoring

KINETiQ uses high-tech testing and training equipment to establish a baseline athlete profile, and track athlete progress over time. This system also allows us to prescribe precise training loads for optimal strength, speed, and power development.

Monthly performance tests may include:

- Speed testing and profiling with precise speed testing equipment.
- Strength and power profiling with force plates.
- Movement efficiency assessments (mobility, sprint mechanics, etc).
- Injury risk indicators (asymmetries detected on force plates and sprint testing equipment).
- Sport-specific performance KPIs (e.g., rotational power for baseball athletes).

The KINETiQ Training Philosophy

Our training philosophy is grounded in the principles of Long-Term Athletic Development (LTAD), which emphasize developing the complete athlete—not just sport-specific skills, but movement quality, physical literacy, resilience, and a lifelong love for training. Research in youth performance and sport science consistently shows that early, well-rounded development that includes strength, speed,

coordination, mobility, and fundamental movement skills leads to better performance outcomes, reduced injury risk, and greater long-term success than early specialization alone. While our environment supports baseball performance, our priority is to build durable, adaptable athletes who can move efficiently, produce force safely, and handle the demands of sport over time. This means progressive, age-appropriate training that respects growth and maturation, reinforces sound habits, and prioritizes quality over shortcuts. We take a holistic approach—developing the physical, mental, and behavioral aspects of the athlete—so they not only improve measurably, but also learn to enjoy the training process, build confidence, and establish lifelong performance habits. Meaningful athletic development takes time, consistency, and intentional programming, and we do not cut corners; instead, we invest in a structured, evidence-informed process that helps athletes fall in love with training while steadily becoming stronger, faster, more resilient, and better prepared for both baseball and long-term athletic success.

Based on this philosophy, athletes can expect to learn the following training modalities:

- Foundational Strength Training: Progressive, age-appropriate strength development using fundamental movement patterns (squat, hinge, push, pull, lunge, and rotate) to build a strong and durable athletic base.
- Power and Explosive Training: Structured development of rate of force production through jumping, medicine ball throws, and Olympic-derivative movements to enhance athletic explosiveness.
- Speed and Sprint Development: Acceleration, sprint mechanics, and resisted/assisted sprint work to improve first-step quickness, running efficiency, and overall speed.
- Change of Direction and Agility Training: Multi-directional movement, deceleration control, and reactive drills to improve athleticism and sport transfer.
- Motor Control and Movement Competency: General athletic movement training including coordination, balance, spatial awareness, and fundamental locomotion (forward, backward, lateral, and rotational movements).
- Mobility and Movement Quality: Targeted mobility, flexibility, and joint control work to support healthy movement patterns and reduce injury risk during growth and development.
- Arm Care and Shoulder Health: Evidence-informed shoulder, scapular, and trunk stability training to support the demands of throwing and long-term upper extremity health.
- Core and Trunk Development: Anti-rotational, rotational, and stability-based trunk training to improve force transfer, posture, and total-body athletic performance.
- Work Capacity and Conditioning: Age-appropriate conditioning to build endurance, recovery capacity, and the ability to tolerate training and sport demands.
- Performance Monitoring and Feedback: Objective assessment and data-informed training adjustments to ensure safe progression, measurable improvement, and long-term athletic development.
